What are the results of this study?

Results summary:
Patients with schizophrenia obtained significantly lower scores versus the control group in regard to all the measured cognitive functions.

Deficits regarding executive functions do not seem to be at a significant level among the youngest group, whereas they are more noticeable in the group of 46–55-year-olds.

Executive functions are significantly lowered in the group aged 36–45 in comparison to the “younger” groups. The level of cognitive functions shows a mild exacerbation in connection with age, whereas cognitive rigidity proved to be related to the number of years spent without hospital treatment.

How precise are the results?

This study does not report confidence intervals, therefore the precision cannot be determined.

*Notes on confidence intervals [used to determine precision of results]*

Confidence intervals (CI) describe the uncertainty inherent in the observed effect and describe a range of values within which one can be reasonably confident that the true effect actually lies. If the CI is relatively narrow, the effect size is known precisely. If the interval is wider the uncertainty is greater, although there may still be enough precision to make decisions about the utility of the intervention. Intervals that are very wide indicate that we have little knowledge about the effect, and that further information is needed.

The width of the CI for an individual study depends to a large extent on the sample size. Larger studies tend to give more precise estimates of effects (and hence have narrower CI) than smaller studies.

Do you believe the results?

What do the study findings mean to practice (i.e. clinical practice, systems or processes)?

What are your next steps? (e.g. evaluate clinical practice against evidence-based recommendations; organise the next four journal club meetings around this topic to build the evidence base; organize training for staff, etc.)

What is required to implement these next steps?
The International Centre for Allied Health Evidence (ICAHE)
